AN IMPLANT

TECHNICAL FIELD

The present invention relates to the field of medical technology and more specifically to the field of implantology, and relates to implants made of a porous, non-toxic material
5 having a total open porosity exceeding 5 % by volume but not exceeding 80 % by volume within at least a portion of the implant.

BACKGROUND ART

10 When implant materials are used and are subjected to a substantial mechanical load, a high strength is the primary requirement. This is achieved by using essentially conventional construction materials - e.g. stainless steel, cobalt-chromium alloys, titanium and titanium-alloys, various
15 ceramic materials and polymers. In order to fix implants, it is common practice to utilize a topographical surface or pores. In this connection special requirements as to holding and bone ingrowth must be met. A prior Swedish patent application No. 9101677-4 includes some important new aspects
20 regarding primarily the pore size distribution. Thus, specific and complex pore size distributions can be utilized to accommodate bone ingrowth-promoting agents and to provide a satisfactory bone ingrowth in large pores.

25 BRIEF DISCLOSURE OF THE INVENTION

The object of the present invention is to provide an improved implant as compared to the implant according to said Swedish patent application No. 9101677-4. The present invention relates more specifically to substantially limiting
30 the porosity of micropores by adding bone ingrowth-promoting agents through carriers, which completely or partially fill micropores as well as pores or cavities in the surface layer, which makes the need of a large available surface less important. Thus, another object of the invention is to
35 improve the bone ingrowth and the healing not only by creating geometrical opportunities for a satisfactory ingrowth

but also by allowing a time control of the bone ingrowth, through different concentrations and release of active agents.

5 Generally, the purpose of the invention is to provide implants having the following characteristics: high strength, excellent biocompatibility by using bone ingrowth-promoting agents deposited in pores or in surface areas for time controlled bone ingrowth in order to achieve an improved
10 reproduceable holding of the implant.

These and other objects of the invention can be achieved therein that communicating micropores, having a size of 10 μm or less, make up not more than 10 % of the total pore
15 volume in said at least one portion of the implant, and that at least 5 % of at least one section of the surface of the implant is covered by substantially evenly distributed pores having a pore size not exceeding 50 μm .

20 The term pore size is defined, as far as pores having pore sizes smaller than or equal to 50 μm are concerned, as sizes calculated by means of conventional Hg-porosimetry, the relation between the pressure and the pore diameter (2r) being obtained through the expression:

25
$$p = \frac{2 s \cos F}{r} , \text{ in which:}$$

p = the pressure

s = the surface tension of Hg for a certain temperature;

and

30 F = the miniscus angle (marginal angle; referens see L C Ritter and R L Drake, Ind. Eng. Chem. 17 782 (1945))

Pore sizes exceeding 50 μm are defined as sizes obtained through an optical measurement in a light microscope on a
35 cross section of the specimens in a section made at a depth

of 0.1 μm and in a section perpendicular to the surface of the specimen, respectively.

The larger pores preferably are limited to, i.e. exist
5 essentially only in the surface layer, more particularly are limited to a surface layer having a thickness of 3 mm, preferably 2 mm and suitably 0.3 mm. If for the rest the porosity is limited to a microporosity, i.e. to pores not larger
10 than 10 μm in diameter and having a total volume of micropores of not more than 10 %, a high strength can be maintained.

In the pores one or several of those agents, which include bone-promoting agents, agents for bone growth or bone in-
15 growth, are deposited before the implantation, which agents can be included in a carrier, which can be made of a polymer, a hydrogel or the like. Due to the fact that the pores can be completely filled with the carrier and the included active agents, which both of them will successively be re-
20 leased, pores will gradually be available for bone ingrowth. In this way various profiles for the bone ingrowth can be achieved by means of suitable concentration levels and distributions of active agents. Also, the release rate can be controlled by selecting carriers having different degrees
25 of solubility. Different carriers can be used in different layers and/or in different parts of the implant in order to obtain an optimal ingrowth, e.g. a fast initial ingrowth (increased short-time release) designed to provide a quick holding and subsequently a slower ingrowth designed to provide
30 a denser and stronger bone tissue.

Additional aspects and characteristic features of the present invention are set forth in the accompanying claims.

CLAIMS

1. An implant made of a porous non-toxic material having a total open porosity exceeding 5 % by volume but not exceeding 80 % by volume within at least one portion of the
5 implant;
c h a r a c t e r i z e d in that
- communicating micropores having a size of not larger than 10 μm make up not more than 10 % of the total pore volume in said at least one portion of the implant; and
10 - at least 5 % of at least one section of the surface of the implant is covered by substantially evenly distributed pores having a pore size exceeding 50 μm .
2. An implant according to claim 1, c h a r a c t e -
15 r i z e d in that the size of the micropores is less than 5 μm and preferably less than 2 μm .
3. An implant according to any of claims 1 and 2, c h a -
20 r a c t e r i z e d in that the micropores make up not more than 5 % by volume of the implant.
4. An implant according to any of claims 1-3, c h a -
r a c t e r i z e d in that the surface/surface layer within said at least one section of the implant is covered
25 by pores (cavities) having a diameter size in the range 50-500 μm .
5. An implant according to any of claims 1-4, c h a -
r a c t e r i z e d in that the main portion of the large
30 pores in the surface layer have a diameter size within the range 75-400 μm , preferably within the range 100-300 μm and suitably within the range 150-250 μm .
6. An implant according to any of claims 1-5, c h a -
35 r a c t e r i z e d in that the large pores (cavities)

exist in a surface layer, which has a thickness of 3 mm, preferably 2 mm and suitably 0.3 mm.

5 7. An implant according to any of claims 1-6, c h a -
r a c t e r i z e d in that said at least one portion of
the implant mainly consists of one or more materials, which
are selected those materials which comprise from calcium
phosphate materials, titanium, cobalt-chromium-alloys,
10 stainless steels, silicon nitride and other types of cerams,
and polymers.

8. An implant according to any of claims 1-7, c h a -
r a c t e r i z e d in that pores or surface areas of the
implant surface or parts thereof contain deposited sub-
15 stances having desirable medical and/or biological
functions.

9. An implant according to any of claims 1-8, c h a -
r a c t e r i z e d in that the deposited substance is made
20 up of one or more bone ingrowth factors, preferably one or
more of the substances IGF, PDGF, BMP and TGF.

10. An implant according to any of claims 1-8, c h a -
r a c t e r i z e d in that the deposited substance con-
25 sists up of one or more antibiotics.

11. An implant according to any of claims 1-8, c h a -
r a c t e r i z e d in that the deposited substance
consists of Ca-compounds of phosphate-type or fluorides.
30

12. An implant according to any of claims 1-8, c h a -
r a c t e r i z e d in that hyaluronic acid is deposited in
the pores.

35 13. An implant according to any of claims 1-12, c h a -
r a c t e r i z e d in that the deposited substances are

included separately or in combination, freely or in a gel
and/or a polymer carrier.

14. An implant according to any of claims 1-13, c h a -
5 r a c t e r i z e d in that the deposition of substances is
differentiated to various zones in order to control the
growth rate and the bone tissue quality.

AMENDED CLAIMS

[received by the International Bureau on 10 June 1993 (10.06.93);
original claim 1 amended; other claims unchanged (3 pages)]

1. An implant made of a porous non-toxic material having a total open porosity exceeding 5 % by volume but not exceeding 80 % by volume within at least one portion of the implant; c h a r a c t e r i z e d in
- 5 - that it has communicating micropores having a size of not larger than 10 μm , said communicating micropores making up not more than 10 % of the total pore volume in said at least one portion of the implant;
- 10 - that at least 5 % of at least one section of the surface of the implant is covered by substantially evenly distributed pores having a pore size exceeding 50 μm , and
- that the implant contains bone ingrowth-promoting agents added to the implant through carriers, which completely or partially fill the micropores as well as the pores in the surface layer of the implant.
- 15 2. An implant according to claim 1, c h a r a c t e r i z e d in that the size of the micropores is less than 5 μm and preferably less than 2 μm .
- 20 3. An implant according to any of claims 1 and 2, c h a r a c - t e r i z e d in that the micropores make up not more than 5 % by volume of the implant.
- 25 4. An implant according to any of claims 1-3, c h a r a c - t e r i z e d in that the surface/surface layer within said at least one section of the implant is covered by pores (cavities) having a diameter size in the range 50-500 μm .
- 30 5. An implant according to any of claims 1-4, c h a r a c - t e r i z e d in that the main portion of the large pores in the surface layer have a diameter size within the range 75-400 μm , preferably within the range 100-300 μm and suitably within the range 150-250 μm .

6. An implant according to any of claims 1-5, c h a r a c -
t e r i z e d in that the large pores (cavities) exist in a surface
layer, which has a thickness of 3 mm, preferably 2 mm and suitably 0.3
mm.

5

7. An implant according to any of claims 1-6, c h a r a c -
t e r i z e d in that said at least one portion of the implant mainly
consists of one or more materials, which are selected those materials
which comprise from calcium phosphate materials, titanium, cobalt-
10 chromium-alloys, stainless steels, silicon nitride and other types of
cerams, and polymers.

15

8. An implant according to any of claims 1-7, c h a r a c -
t e r i z e d in that pores or surface areas of the implant surface
or parts thereof contain deposited substances having desirable medical
and/or biological functions.

20

9. An implant according to any of claims 1-8, c h a r a c -
t e r i z e d in that the deposited substance is made up of one or
more bone ingrowth factors, preferably one or more of the substances
IGF, PDGF, BMP and TGF.

25

10. An implant according to any of claims 1-8, c h a r a c -
t e r i z e d in that the deposited substance consists up of one or
more antibiotics.

30

11. An implant according to any of claims 1-8, c h a r a c -
t e r i z e d in that the deposited substance consists of
Ca-compounds of phosphate-type or fluorides.

35

12. An implant according to any of claims 1-8, c h a r a c -
t e r i z e d in that hyaluronic acid is deposited in the pores.

13. An implant according to any of claims 1-12, c h a r a c -
t e r i z e d in that the deposited substances are included
separately or in combination, freely or in a gel and/or a polymer
carrier.

14. An implant according to any of claims 1-13, characterized in that the deposition of substances is differentiated to various zones in order to control the growth rate and the bone tissue quality.
